## **Disclaimer**

---

### **Scientific evidence**

The compilation of information on the plants' traditional medicinal uses in this book has been taken from traditional medicinal texts and most of their described effectiveness possess little or no scientific evidence. Although extensive research has been done on some plants, there is still a huge gap that requires further pre-clinical and clinical trials in order to validate the claims scientifically. It is strongly advised that the information is to be taken in the context of "reported", "recorded" or "alleged" uses. Reader's discretion should be used and advice from medical doctors or trained alternative medicine practitioners should be acquired. This is particularly important especially for certain diseases like tumours, cancers, hypertension, diabetes, angina pectoris and other potentially fatal diseases and ailments.
